LivableCities

Greener streets for resilient cities

In Utrecht, narrow residential, garden, and shared space streets are being rethought to make room for more trees. Building on work that mapped different street typologies and the challenges linked to them, the city now explores how tree planting can be realised in neighbourhoods where space is tight and conditions are very difficult.

Step by step, and together with residents, experts and LivableCities partners, these everyday streets are being transformed into greener, cooler, and more resilient places.
